                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The C-terminal group is .WH2 or -OH. The sequence includes the four residue sequence Pro-Asp-Gly-Arg which constitutes residues 36-39 of basic FGF; it is also antagonistic to acidic FGF. The antagonist modulates growth of epithelial (and related) cells and can be used diagnostically or therapeutically, eg to treat proliferative diseases of eyes and kidneys, some types of tumours and adrenal vascularisation. It is able to bind with heparin or with the FGF
                                                                                   The peptide bFGF(24-68)-NH2 (100mcg/ml) radioactive bFGF bound to the BHK cells affinity to bind heparin.
                                                                                                                                                                                                                                                New fibroblast growth factor peptide(s) - are FGF antagonists used to inhibit cell growth in culture or in disease e.g. retinopathy, glomerulonephritis, melanoma etc.
                                                                                                                                                                                               Example 1; Column 10; 12pp;
                                                                                                                                                                                                                                                                                                                                                                   WPI; 1993-336156/42.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Ş
                                                                  Using plasmid pTB796, E.coli MM294 was transformed, whereby the strain E.coli MM294/pTB796 was obtained, which (IFO 14701, FERM BP-1661) harbors the plasmid pTB796 expressing the mutein represented here. The amino acid sequence Lys 87 to Ser 147 has been deleted. The mutein has high stability and is low in toxicity. It can be used as a healing accelerator for e.g. burns, wounds or postoperative tissues or as a therapeutic drug based on its angiogenic action for e.g. thrombosis or arteriosclerosis. It can also be used as a reagent for acceleration of cell cultivation. A mutein where at least one constituent cysteine is replaced by serine is preferred because the mutein is highly stable and intermolecular bridges are reduced or eliminated.

The data of the constituent of the constituent of the constituent of the constituent cysteine is replaced by serine is preferred because the mutein is highly stable and intermolecular bridges are also AANB1971-97.

                                                                                                                                                                                                                                                                                        rhbFGF mutein CS102 (encoded by AAN90401) lacks 46 C-terminal AAn basic fibroblast growth factor. It has high fibroblast growth promoting, vasoendothelial cell growth promoting, and angiogenic activities, and has high stability and low toxicity. It is used accelerate healing of, eg burns, wounds and postoperative tissues drug for thrombosis or arteriosclerosis, or as a reagent to accel

It has high fibroblast growth promoting, vasoendothelial cell growth growthing, vasoendothelial cell growth promoting, and angiogenic activities, and has high stability and low toxicity. It is used to accelerate healing of, eg burns, wounds and postoperative tissues, a drug for thrombosis or arteriosclerosis, or as a reagent to accelerate the control of the control of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    to enhance bone fracture healing or bone growth processes and wound healing processes. (I) is useful in detection and treatment of various FGFR related disorders including skeletal disorders e.g. achondroplasia, hypochondroplasia, and osteoporosis, and cartilage defects, multiple myeloma, epithelial cancers such as transitional cell carcinoma of the bladder and cervical carcinoma. The novel mutants are useful in high expression systems suitable for pharmaceutical production, targeting of drugs or other agents to tissues and cells having specific FGFR subtypes, and serve as template for the formation of improved agonists and antagonists of FGFRs in various disorders such as skeletal disorders and cancer. The present sequence represents a FGF core structure amino acid sequence which is given in the exemplification of the present invertice.
                                                                        rhbFGF mutein C123 (encoded by AAN90405) lacks 24 C-terminal amino a of basic fibroblast growth factor. It has high fibroblast growth promoting, vascendothelial cell growth promoting, and angiogenic activities, and has high stability and low toxicity. It is used to accelerate healing of, eg burns, wounds and postoperative tissues, a drug for thrombosis or arteriosclerosis, or as a reagent to accelera
                                                                                                                                                                                 Disclosure; Fig.
                                                                                                                                                                                                                Muteins of basic fibroblast growth factor - lacking amino acids, having growth promoting and angiogenic

                                                                        strain E.coli MM294/pTB856 was obtained, which harbors the plasmid pTB856 expressing the mutein represented here. The amino acid sequence from Lys130 to Ser147 has been deleted.

The mutein has high stability and is low in toxicity. It can be used as a healing accelerator for e.g. burns, wounds or postoperative tissues or as a therapeutic drug based on its angiogenic action for e.g. thrombosis or arteriosclerosis. It can all be used as a reagent for acceleration of cell cultivation. A mutein where at least one constituent cysteine is replaced by serine is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Key
Misc-difference
  preferred because the mutein is highly stable and intermolecular bridges and linkages are reduced or eliminated. See also AAN81971-97.

                                                                                                                             rhbFGF mutein C129 (encoded by AAN90406) lacks 18 C-terminal amino acide of basic fibroblast growth factor. It has high fibroblast growth promoting, vascendothelial cell growth promoting, and angiogenic activities, and has high stability and low toxicity. It is used to accelerate healing of, eg burns, wounds and postoperative tissues, as drug for thrombosis or arteriosclerosis, or as a reagent to accelerate cell cultivation. Cys 70 and Cys 88 may be replaced by Ser (see

                                                                                                                                                                                                                                                                    rhbFGF mutein CS23C129 (encoded by AAN90408) lacks 18 C-terminal AAs of basic fibroblast growth factor. It has high fibroblast growth promoting, vasoendothelial cell growth promoting, and angiogenic activities, and has high stability and low toxicity. It is used to accelerate healing of, eg burns, wounds and postoperative tissues, as a drug for thrombosis or arteriosclerosis, or as a reagent to accelerate cell cultivation. Cys 70 and Cys 88 have been replaced by Ser
Human basic fibroblast growth factor (FGF).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CC large quantities of fusion proteins, in which the fusion partner lacks a CC leader sequence, via fermentation culture according to standard CC recombinant DNA methodologies. The polypeptide of interest is cleaved CC away from the rest of the fusion protein by proteolytic digestion. A CC variety of polypeptides may be produced in this manner including CC enzymes, growth factors, single chain antibodies DNA-/RNA- binding CC proteins, membrane receptors, mutant IGFB-3s and fragments of them. CC Additionally, the invention may be used in the screening of libraries of CC random polypeptides by assays for their biological function. When fused CC random polypeptides by assays for their biological function. When fused CC accumulate in a protected cellular compartment in a soluble active form. CC Leaderless fusion proteins may be produced in a wide variety of host CC ells (e.g. Escherichia coll), in a soluble, active and easily recoverable form at temperature at or close to the physiological optima CC for host cell growth. A wide variety of polypeptides, including those CC that are otherwise unstable or insoluble may be expressed as fusions CC unstable. Sequences AAX17992-996 represent five members of the II-1-like
                                                                                                                                                                                                                                                                                                      Query Match

                                                                                                                                                                                                                               Using plasmid pTB795, E.coli MM294 was transformed, whereby the strain E.coli MM294/pTB795 was obtained, which (IFO 14700, FERM BP-1660) harbors the plasmid pTB795 expressing the mutein represented here. The amino acid sequence Pro2-Pro14 has been deleted. The mutein has high stability and is low in toxicity. It can be used as a healing accelerator for e.g. burns, wounds or postoperative tissues or as a therapeutic drug based on its angiogenic action for e.g. thrombosis or arteriosclerosis. It can also be used as a reagent for acceleration of cell cultivation. A mutein where at least one constituent cysteine is replaced by serine is preferred because the mutein is highly stable and intermolecular bridges and linkages are reduced or eliminated.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 24-FEB-1987;

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          밁
Sequence 2, Application US/097713UZ
Patent NO. US20020072489A1
GENERAL INFORMATION:
APPLICANT: Whitehouse, Martha J.
TITLE OF INVENTION: Angiogenically Effective Unit Dose of FGF-2 and Method
TITLE OF INVENTION: of Use
FILE REFERENCE: 1296/12169US04
CURRENT APPLICATION NUMBER: US/09/771,302
CURRENT FILING DATE: 2001-01-26
PRIOR APPLICATION NUMBER: 09/385,114
PRIOR APPLICATION NUMBER: 60/104,102
PRIOR FILING DATE: 1999-08-27
PRIOR FILING DATE: 1998-08-10-13
PRIOR FILING DATE: 1998-10-13
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ; TYPE: PRT

```

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

A32398
A32398
Asia fibroblast growth factor precursor, 22.5K form - human
N;Alternate names: bFGF; fibroblast growth factor 2; prostatic growth factor; prostatrop
N;Contains: basic fibroblast growth factor, 18K form
C;Species: Homo sapiens (man)
C;Date: 31-Jul-1989 #sequence revision 31-Dec-1993 #text change 21-Jul-2000
C;Accession: A32398; A61537; A2642; B32878; S00297; A54316; B34316; A33624; A25824; B24
